

Guide the power supply
from the top to the
operating element

When using an empty tube
in the soil, the tube and
the crossbar can be
dropped and vice versa.

We point out the minimum requirement of the foundation
in our plans. The condition of the specific local situation
(for example: ground under the foundation) does not
lie our responsibility. The installation situation must
be individually specified from the planning architect
or structural engineer.

This means that there is a commitment on site
of the foundation (foundation size, thickness, reinforcement ...) taking into account the acting cut sizes
and anchoring operations must take place.

Prepared by customer at the operating column:
power supply: 1PH,N+PE,230V,50Hz
motor power: 2x 3kW
fuse: 30 Ampere, time lag
air pressure for pneumatic arms: inner diameter 1/4" 6-10bar

for optional energy set:
power supply (not connected to control unit)
power supply depends on the country

Recommendations for dowels can be found
in the manual.

Observe the min. anchorage of the dowels.
With floor pavements use longer dowels.

Observe the regulation of the dowel manufacturer.

max. static forces and momentums
per column:
F_z = 38,8 kN
M_x = ± 47,2 kNm
M_y = + 31,7 kNm
dynamic factor c = 1,151
max. allowed load distribution of the car:
1:3 or 3:1 (DIN EN 1493:2022)

* Recommended installation width. An installation width up
to 140 9/16" is possible without reducing the rated load capacity.
Hydraulic hoses or cables must be extended accordingly

All dimensions in inch
Dimensions and design changes reserved!
